

STERISAFE™
ADVANCED DECONTAMINATION TECHNOLOGIES

Sterisafe delivers quick and safe whole room disinfection

Sterisafe UK will launch the new Sterisafe™-PRO whole room disinfection robot at this year's IPS Vevent. The Automated Room Disinfection Robot (ARDR) provides Full Depth Disinfection Cycle (FDDC). This is a unique and patented technology which performs disinfection without the use of noxious chemicals or by-products such as nano-particles.

The ARDR process is fully automated and monitored by the operator via wireless technology from a tablet.

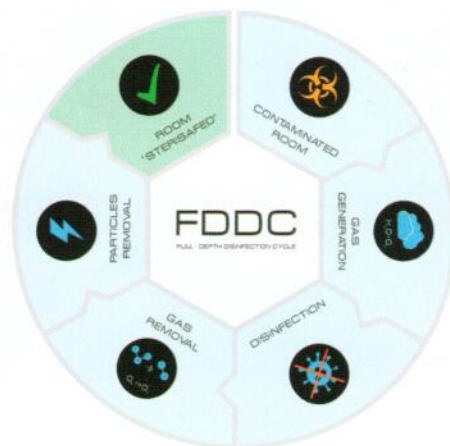

Using only water and air the room is entirely disinfected with no shadow area and

safe to enter-free from bacteria, viruses, fung odour, residual chemicals, and harmful particles.

The FDDC cycle takes between one and four hours depending on the room size. Sensors continually monitor the concentration of the biocide agent and indicate the end of the cycle allowing for immediate room access. Due to an active removal of the biocide agent, the room can be re-entered rapidly and safely.

To find out more and to discuss this unique technology - with the view for an on-site demo - please visit us at IPS.
